

1. I believe the classification of a DC source and then having subwaveform options for voltage sources that act as a sine waves still under the category of DC source is a bad idea. I understand wanting a variety of voltage sources but the two should conflate. We should not have DC options and AC options intertwined only if it makes complete sense. If expostential is more closely related to DC then maybe but selection of it should completely swap the component to be the corresponding one.

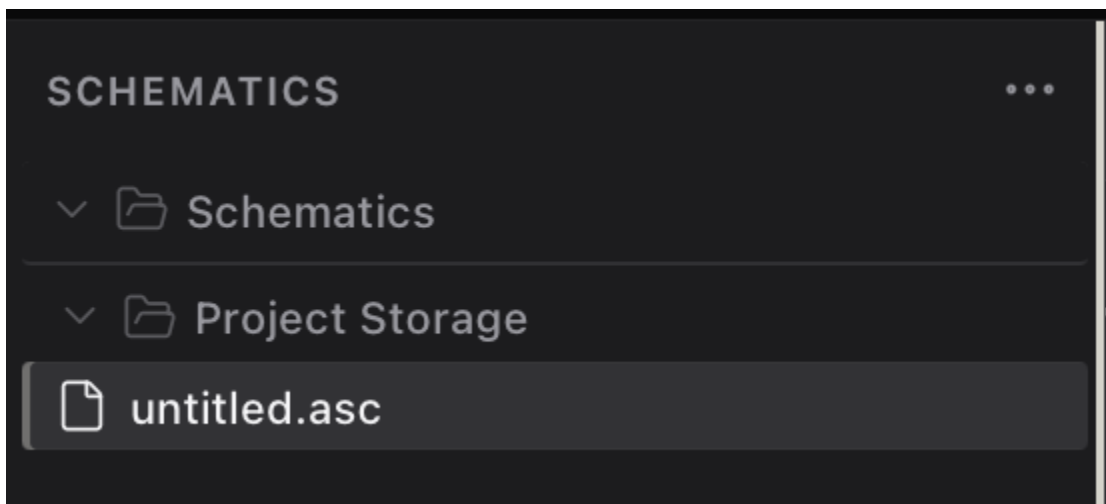

For example I envision someone selecting a DC source. Then in the V# properties they might change their mind and want an AC signal that should replace the drawing which it already does and also replace any sign of its former self. The same should apply to the different modes. (ask follow up questions if unsure)

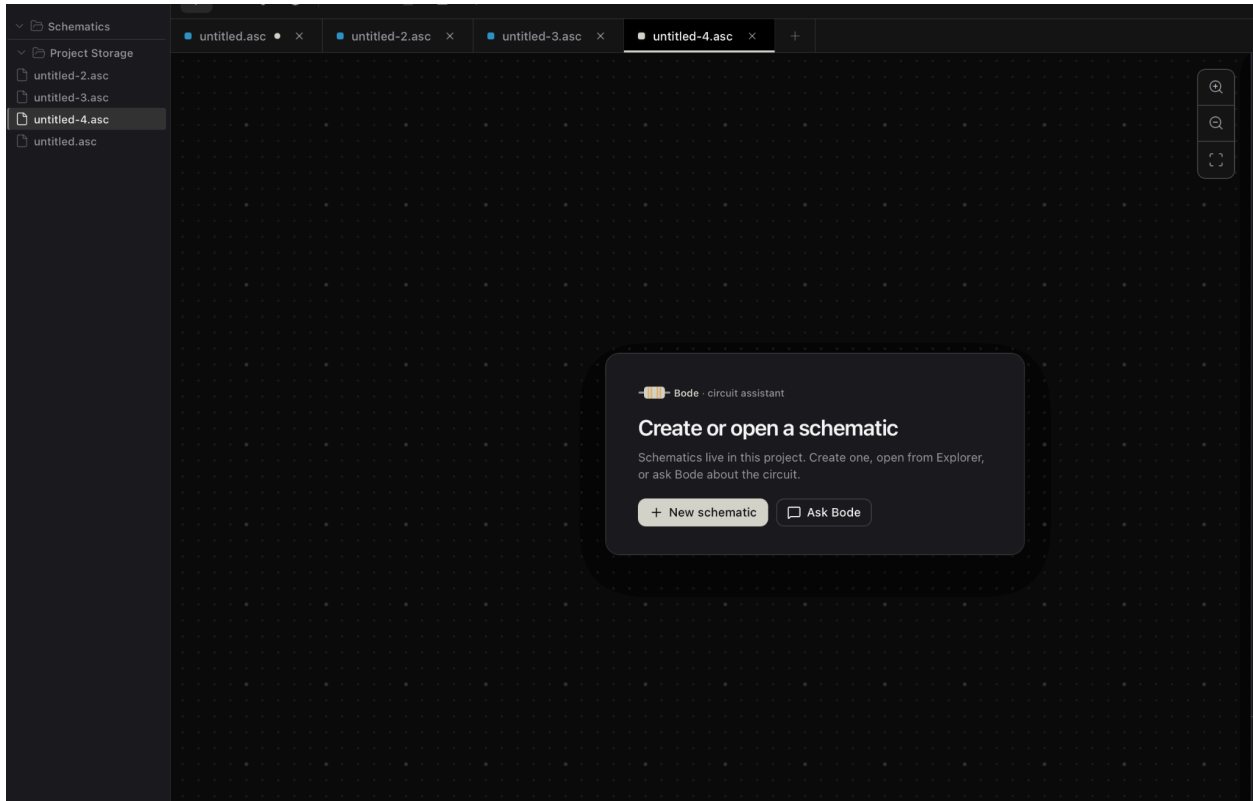

2. I am unable to drag untitled.asc into the project storage folder. I should be able to drag and drop the file there.

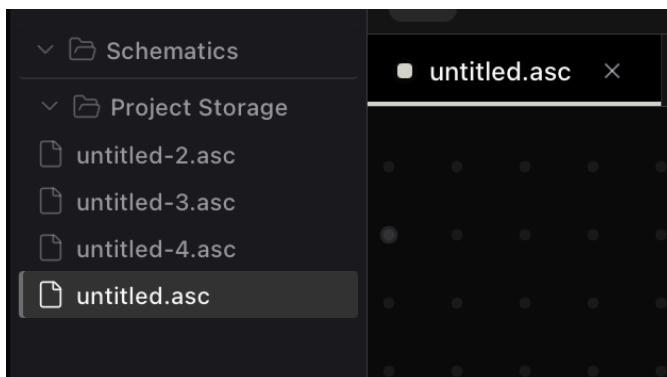

3. The LED should not have a color.

4. There is ample space to show the settings I like the current three dot approach but we should be able to see them at a smaller window size as long as it has decent space from the text of the folder name it should be able to dynamically adjust.

4. If we are already in an empty schematic the wording should be more of a place a component down. I imagine it highlighting or emphasizing the component library it should almost guide the user to use the components we have or you can ask Bode to create one. Change the wording on this screen.

5. If i click dont save and theyre empty then they should probably be deleted.

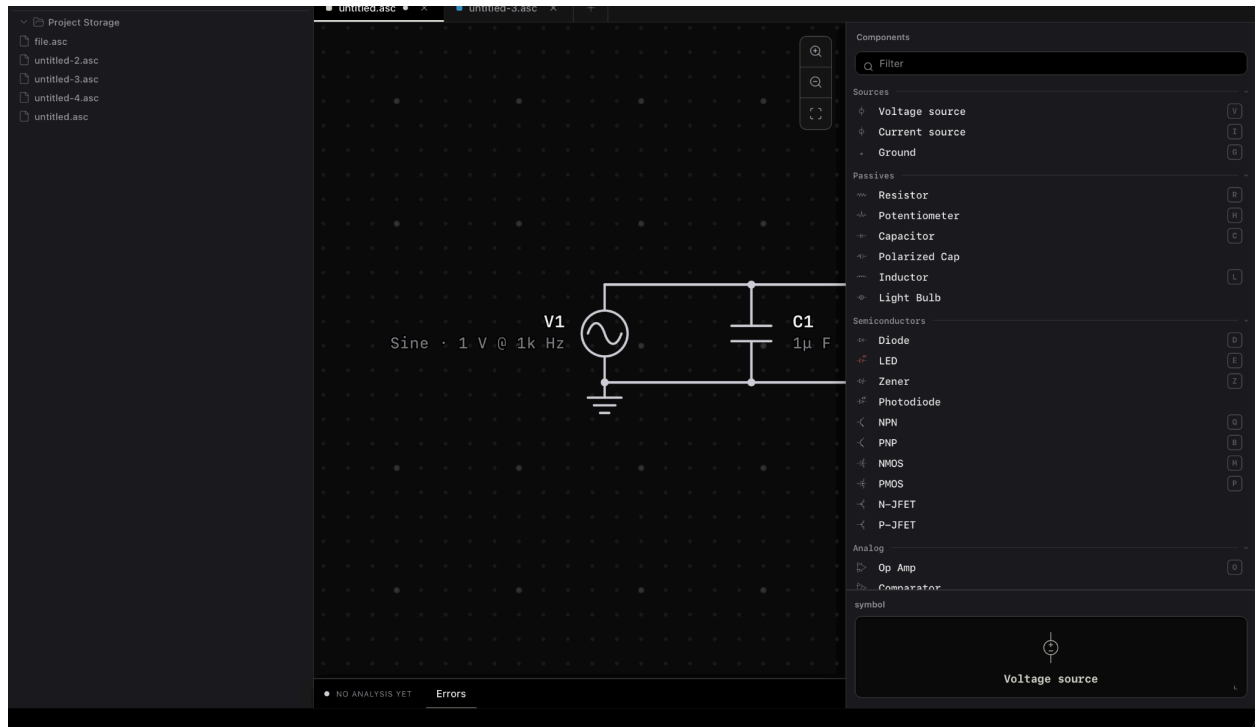

6. Id like for the files to look indented almost to denote they live within a folder

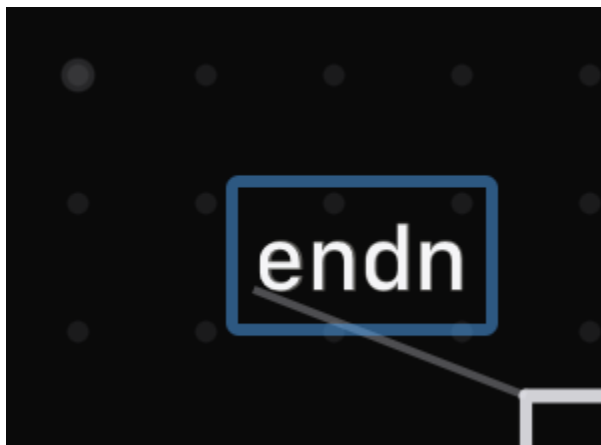

7. Absolutely no overlap between labels EVER.

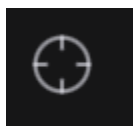

8. This component should always be facing upwards the point facing up when dropped into schematic

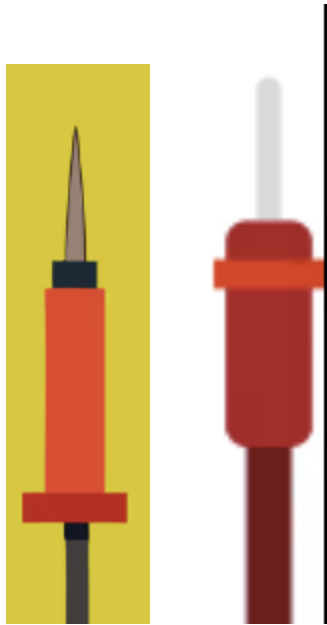

10. The autocentering button does not work. It needs to work dynamically as the user resizes each tab.

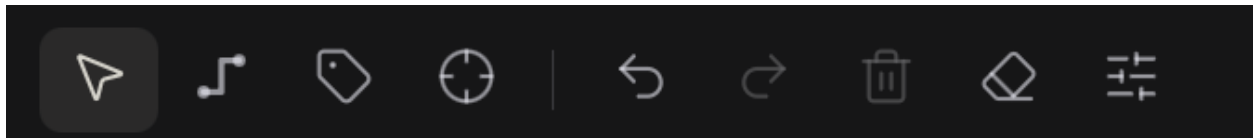

11. Naming a node I should be able to select the text box and hit backspace to delete it.

12. Replace the probe sign with a red multimeter probe something like the following:

NEXT ITEM:

13. In spirit with item 12: I'd like to add more color and make this toolbar pop a bit more. For example maybe a slight bold would be better but using the design guidelines we have I'd like icons with color schemes like the design reference images. For example a pink/grey metal eraser, a gray trascan, different color do and undo buttons. A tag that looks like a real tag. A red wire. The goal is to just have these items look like their real counterparts while maintaining the strict style guides. You should source icons from internet and try to avoid creating only if that's the last resort. Ask me if you have any questions.

14. In the schematic bottom tab. I believe just having an errors section to show what is wrong with the schematic is more than enough measurements are displayed in simulator tab. This errors section should be robust and try to catch errors before the user has hit run simulation.

COMPLETE 7 ms · 456 samples			Measurements	Errors
C1	Time-varying Capacitor			
VOLTAGE RMS		5.05 V		
CURRENT FINAL		6.28 mA		
POWER FINAL		31.4 mW		
R1	Time-varying Resistor			
VOLTAGE RMS		5.05 V		
CURRENT RMS		5.05 mA
